"Specific and distinct expression patterns of two members of the thionin multigene family of barley in transpenic tobacco.";
Submitted (MAR-1996) to the EMBJ/Genbank/DDBJ databases.
-!- FUNCTION: THIONINS ARE SMALL PLANT PROTEINS WHICH ARE TOXIC TO ANIMAL CELLS. THEY SEEM TO EXERT THEIR TOXIC EFFECT AT THE LEVEL.
OF THE CELL MEMBRANE. THE PRECISE FUNCTION, IN PLANTS, OF THESE PROTEINS IS NOT KNOWN (BY SIMILARITY).
-!- SIMILARITY: BELONGS TO THE PLANT THIONIN FAMILY.

This invention describes a novel antibody specifically recognizing phosphatidylinositol-3,4,5-triphosphate (PIP3). The antibody of the invention is used in immunogenic compositions in which a dead salmonella genus microbe is used as an adjuvant and mixed with PIP3. The antibody can be used in an immunoassay containing a step in which the above antibody or its variable region is reacted with PIP3 present in a sample and the bond based on their immunological reaction. The method can determine PIP3 easily in a high sensitivity. This sequence represents the mutine PIP3 recognizing monoclonal antibody variable region heavy chain complementarity determining region, CDR3 described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel antibody specifically recognizing phosphatidylinositol-3,4,5-triphosphate (PIP3). N-terminus, one or more epitopes that bind specifically to must, one of more epitopes that bind specifically to autoantibodies (Abb) against the islet cell antigen IA2 and, at its C-terminus, one or more epitopes that bind specifically to antibodies (Ab) directed against the glutamate decarboxylase GAD65. (I), also nucleic acid (II) encoding it, vectors containing (II) and transformed cells, are useful for diagnosis and prognosis of diabetes mellitus type I, stiff-man syndrome, polyglandular autoimmune syndrome or other autoimmune conditions associated with Abb against GAD65 or IA2. (I) provides a rapid and simple diagnosis of high specificity and sensitivity, capable of recognizing antibodies against both IA2 and GAD65, simultaneously. Unlike known fusions, where the GAD65 component is at the N-terminus, (I) contains correctly folded conformational epitopes that can react with most MICA autoantibodies. This sequence represents the human autoantibody MICA-3 variable region light chain used in the method of the invention.
                                                                                                                                                                                                                                                       Autoantigen, fusion protein, islet cell antigen, MICA autoantibody, glutamate decarboxylase, diabetes mellitus type I, stiff-man syndrome, polyglandular autoimmune syndrome, autoimmune disorder, IA2; GAD65; variable region, light chain, MICA-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New fusion protein, useful for diagnosis of diabetes type I and other metabolic diseases, is reactive with autoantibodies against both glutamate decarboxylase and islet cell antigen -

                                                                             This invention describes a novel method for preparing a peptide or recombinant antibody, which mimics an antigenic carbohydrate. The peptides and recombinant antibodies prepared to mimic antigenic carbohydrates can be used to enhance binding of anti-antigenic carbohydrates can be used to enhance binding of alliantigenic carbohydrate antibodies to the antigenic carbohydrate, e.g. as vaccine adjuvants. The peptides can be used to inhibit binding of a ligand to a receptor, which is an antigenic carbohydrate. The methods are used to prepare the peptides and antigenic antibodies, which mimic the antigenic carbohydrates. Carbohydrate-conjugate vaccines could be used in tumour in munity and cancer therapy. The peptides and antibodies can also be used as antibacterials. Peptides that mimic carbohydrate antigens can be formulated to develop a longer lasting immune response. Other advantages of the peptides can be precisely defined, (2) the immunogenicity of the peptides can be significantly enhanced by polymerization or addition or relatively small carrier molecules that reduce the total
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      amount of antigen required for immunization, (3) peptide synthesis may be more practical than synthesis of carbohydrate-protein conjugates or the production of anti-idiotypes; (4) peptide mimicking sequences can be engineered into DNA plasmids for DNA vaccination to further manipulate T cell responses. AXY33028-Y33087 represent the carbohydrate antigen peptide mimotopes described in the invention.
                                                                                                                                                                                                                                                                       Mimotope, antigen, carbohydrate, antibody, mimic, vaccine, adjuvant, tumour immunity, cancer therapy, antibacterial, immune response, immunogenicity, anti-idiotype, T cell response manipulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptides and recombinant antibody mimics of carbohydrate antigens, used for, e.g. treatment of cancer and infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    65.6%; Score 40; DB 20; Length 19; 60.0%; Pred.                                                                                     Porphorymonas gingivalis (PG) polypeptide sequences given in AAY34318 to AAY34583. AAX91802 to AAX91989 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

AAX91536 to AAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAX34318 to AAX34583. AAX91802 to AAX91989 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Drosophila; developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Porphorymonas gingivalis (FG) polypeptide sequences given in AAY34318 to AAY34831. AAX51802 to AAX9189 repersent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease

This invention describes a novel method for preparing a peptide or recombinant antibody, which mimics an antigenic carbohydrate. The peptides and recombinant antibodies prepared to mimic antigenic carbohydrates can be used to enhance binding of anti-antigenic carbohydrate antibodies to the antigenic carbohydrate, e.g. as vaccine adjuvants. The peptides can be used to inhibit binding of a ligand to a receptor, which is an antigenic carbohydrate. The methods are used to prepare the peptides and antigenic arribodies, which mimic the antigenic carbohydrates. Carbohydrate-conjugate vaccines could be used in tumour immunity and cancer therapy. The peptides and antibodies can also be used as antibacterials. Peptides that mimic carbohydrate antigens can be formulated to develop a longer lasting immune response. Other advantages of the peptide mimics are; (1) the chemical composition and purity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                    manipulate T cell responses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticidaes, therapeuticis and pharmaceutical fauges. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -

     by chromosome 2 of the human malarial parasite, Plasmodium falciparum.

Also described are: (1) nuclectide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

(I) and (II) are useful for the development of vaccines against C. f. falciparum infection. (I) and polyclonal antisera or a monoclonal antibody raised to immunogens comprising the sequences of (I), are antibody raised to immunogens comprising the sequences of (I), are antibody raised to immunogens comprising the sequences of (I), are conseful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of infection where the falciparum is sequencing of the Plasmodium chromosome 2 and the infection, or they can be used to identify drug resistance in consection of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the consection and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many contine and drug development. Parasite resistance to drugs and mosquito drugs. AAA70078 to AAA70287 and AAB18144 to AAB18352 represent nucleotide and protein sequences given in the present invention, but which are not securities.

The present sequence represents a protein that is involved in gibberellin signal transduction. Inactivation of the gene produces a spindly be hence the Spy gene). The spindly mutation is characterised by alongated petioles, yellow-green leaves, early flowering, long spindly clongated petioles, yellow-green leaves, early flowering, long spindly bolts, partial male sterility and parthencarpic fruit development. These controls are also observed in wild type plants exhibiting a gibberellin overdose syndrome due to external application of gibberellin. A spy phenotypic mutant was isolated from a library of Agrobacterium-mediated controls are ansient on the genome. Seeds from the library were selected for their ability to germinate in the presence of paclobutrazol.

The sys bull to germinate in the presence of paclobutrazol. Introduction of the SPY gene into plants rescues the spindly phenotype. Introduction of the SPY gene into plants rescues the spindly phenotype. The SPY DNA, vectors and proteins can be used to modulate plant and leaf size.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

New proteins useful for treatment of Plasmodium infections in humans,
                This sequence represents the Plasmodium falciparum cytoadherence linked asswalal gene 3.1 (ChAG3.1) protein that facilitates flicked asswalal gene 3.1 (ChAG3.1) protein that facilitates cytoadherence of erythrocytes parasitised with Plasmodium spp. to other cells. It is encoded by a gene located on chromosome 3 of P. falciparum. It is a member of a family of ChAG proteins (see also AAY31945-49). The identification of clag genetic species, and the products encoded by them, enables a range of therapeutic agents to be rationally designed and/or identified that are useful for the prophylaxis and treatment of disease conditions caused or exacerbated by infection with Plasmodium spp., e.g. malaria,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents the Plasmodium falciparum cytoadherence linked asexual gene 2 (CLAG2) protein that facilitates cytoadherence of erythrocytes parasitised with Plasmodium spp. to other cells. It is encoded by a gene located on chromosome 2 of P. falciparum. It is a member of a family of CLAG proteins (see also AAY31945-48). The identification of clag genetic species, and the products encoded by them, enables a range of therapeutic agents to be rationally designed and/or identified that are useful for the prophylaxis and treatment of disease conditions caused or exacerbated by infection with Plasmodium spp., e.g. malaria,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CLAG2; cytoadherence linked asexual gene; CLAG; erythrocyte; red blood cell; malaria; infection; therapy; vaccine.

                                                                                                                                                                                                                                     proteins useful for treatment of Plasmodium infections in humans,
                                                                                                                                                                                                                                                                                                                                    This sequence represents the Plasmodium falciparum cytoadherence linked asexual gene 3.2 (CLAG3.2) protein that facilitates cytoadherence of erythrocytes parasitised with Plasmodium spp. to other calciparum. It is encoded by a gene located on chromosome 3 of P. falciparum. It is a member of a family of CLAG proteins (see also AAY31945-49). The identification of clag genetic species, and the products encoded by them, enables a range of therapeutic agents to be rationally designed and/or identified that are useful for the prophylaxis and treatment of disease conditions caused or exacerbated by infection with Plasmodium spp., e.g. malaria,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

```

The invention relates to novel nucleic acids encoding novel human foetal antigens. The nucleic acids and proteins are used to prevent, treat (e.g. by gene therapy) or ameliotrate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. The antibodies to the antigens can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked include autoimmune diseases e.g. rheumatoid arthritis hyperproliferative disorders e.g. rheumatoid arthritis; hyperproliferative disorders e.g. rheumatoid arthritis; cardioxascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac alseade by bacteria, viruses and fungiand coular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to subburn, to maintain organs before ö Plant, transcription factor; gene expression; eucalyptus; pine; acacia; poplar; sweetgum; teak; mahogany; bZIP; G-box binding factor; basic helix-loop-helix zipper; homeocic; homeodomain; homeobox; MADS; homeocicmain zipper; LIM domain; AP2; EREBS; zinc finger domain; examples of diseases and disorders treated by the nucleic acids and regenerate tissues and in chemotaxis. The polypeptides can also be as a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. Numerous . 0 proteins are given in the specification. The present sequence DB 22; Length 104; Pinus radiata transcription factor protein sequence #113. 1; Mismatches 60.7%; Score 37; 75.0%; Pred. No. AAB32986 standard; Protein; 158 AA (first entry) 6; Conservative | :||||| 29 SNSYYRYG 36 1 SGAYYRYG 8 Local Similarity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel plant transcription factors from Bucalyptus grandis or Pinus radiata. The present sequence is one such transcription factor and set or may be used to produce a plant having modified gene expression such as a woody plant e.g. a eucalyptus, pine, acacia, poplar, sweetgum, teak, or mahogany species or omodify the activity of a polypebide in a plant. The transcription factors of the present invention are members from the following families of regulatory proteins: bZIP, bZIP family of G-box binding factors, basic elix, longophelix zipper, homeotic/homeodomain/homeobox/MADS, homeodomain cys2His2, CCAAT box elements and MYB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;
                                                                                                                                                                                                                                                              New isolated polynucleotide encoding a plant transcription factor for producing a plant e.g. a woody plant, preferably eucalyptus or pine, having modified gene expression or modified activity of a polypeptide
